

University season: 2026/2027

Module: Big Data Analytics

TP01: Python Web Scraping Case-study

All work is uploaded to your GitHub account.

🔧 Requirements:

- ✓ Python 3.x
- ✓ Requests library (for loading web pages)
- ✓ BeautifulSoup library (for parsing HTML)
- ✓ (Optional) pandas for storing data

Questions

1. Write a program that fetches the content of all pages on an educational website and displays the HTML source code on the screen?
2. Use the "BeautifulSoup" library (or other libraries) to extract all quotes from the aforementioned page?
3. Save the results to a CSV file using the pandas library?
4. Ensure the file contains at least 1,000 rows?

Note: Some sites may protect themselves from web scraping, so it's best to start with educational sites.

Good luck
